Chapter ML:II

II. Machine Learning Basics

- □ On Data
- □ Regression
- Concept Learning: Search in Hypothesis Space
- Concept Learning: Search in Version Space
- Measuring Performance

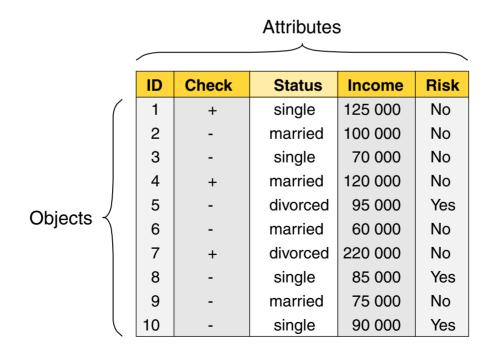

ML:II-1 Basics ©STEIN 2005-2013

- □ An object o ∈ O is described by a set of attributes.
 An object is also known as record, point, case, sample, entity, or instance.
- An attribute A is a property of an object.
 An attribute is also known as variable, field, characteristic, or feature.
- A measurement scale is a system (often a convention) of assigning a numerical or symbolic value to an attribute of an object.

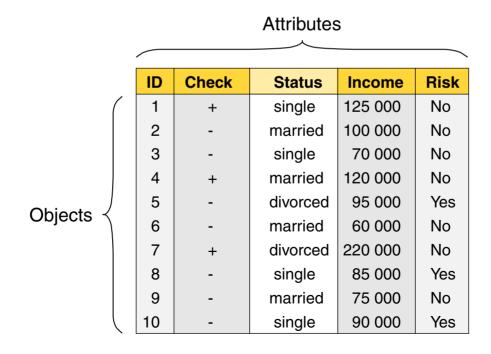

ML:II-2 Basics ©STEIN 2005-2013

- □ An object $o \in O$ is described by a set of attributes. An object is also known as record, point, case, sample, entity, or instance.
- An attribute A is a property of an object.
 An attribute is also known as variable, field, characteristic, or feature.
- A measurement scale is a system (often a convention) of assigning a numerical or symbolic value to an attribute of an object.

ML:II-3 Basics ©STEIN 2005-2013

- □ An object $o \in O$ is described by a set of attributes. An object is also known as record, point, case, sample, entity, or instance.
- An attribute A is a property of an object.
 An attribute is also known as variable, field, characteristic, or feature.
- A measurement scale is a system (often a convention) of assigning a numerical or symbolic value to an attribute of an object.

ML:II-4 Basics ©STEIN 2005-2013

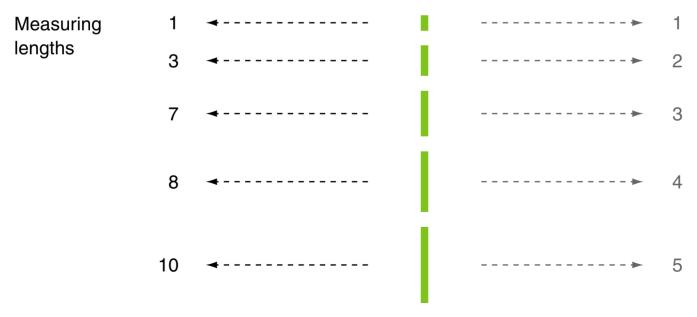

- Attribute values may vary from one object to another or one time to another.
- The same attribute can be mapped to different attribute values.

Example: height can be measured in feet or meters.

Different attributes can be mapped to the same set of values.

Example: attribute values for person ID and age are integers.

The way an attribute is measured may not match the attribute's properties:

ML:II-5 Basics ©STEIN 2005-2013

Types of Attributes

| Туре | | Comparison | Statistics | Examples | |
|------------------------------|---------|---|--|--|--|
| categorical (qualitative) | nominal | values are names, only information to distinguish objects | mode, entropy, contingency, correlation, χ^2 test | zip codes, employee IDs, eye color, gender: {male, female} | |
| | | = ≠ | | | |

ML:II-6 Basics ©STEIN 2005-2013

Types of Attributes

| Туре | | Comparison | Statistics | Examples |
|------------------------------|---------|---|--|--|
| categorical (qualitative) | nominal | values are names, only information to distinguish objects | mode, entropy, contingency, correlation, χ^2 test | zip codes, employee IDs, eye color, gender: {male, female} |
| | | $=$ \neq | | |
| | ordinal | enough information to order objects | median, percentiles, rank correlation, | hardness of minerals, grades, street |
| | | < > \leq \geq \geq | run tests, sign tests | numbers, quality: {good, better, best} |

ML:II-7 Basics ©STEIN 2005-2013

Types of Attributes

| Туре | | Comparison | Statistics | Examples |
|------------------------------|----------|---|---|---|
| categorical (qualitative) | nominal | values are names, only information to distinguish objects $= \neq$ | mode, entropy, contingency, correlation, χ^2 test | zip codes, employee IDs, eye color, gender: {male, female} |
| | ordinal | enough information to order objects < > \leq \geq \geq | median, percentiles, rank correlation, run tests, sign tests | hardness of minerals, grades, street numbers, quality: {good, better, best} |
| numeric (quantitative) | interval | differences are meaningful, a unit of measurement exists + – | mean, standard deviation, Pearson's correlation, t -test, F -test | calendar dates, temperature in Celsius, temperature in Fahrenheit |

ML:II-8 Basics ©STEIN 2005-2013

Types of Attributes

| Туре | | Comparison | Statistics | Examples | |
|------------------------------|---------|---|---|--|--|
| categorical (qualitative) | nominal | values are names, only information to distinguish objects | mode, entropy, contingency, correlation, χ^2 test | zip codes, employee IDs, eye color, gender: {male, female} | |

| | | < > < ≥ | run tests, sign tests | numbers, quality: {good, better, best} | |
| numeric (quantitative) | | differences are meaningful, a unit of measurement exists + - | mean, standard deviation, Pearson's correlation, t -test, F -test | calendar dates, temperature in Celsius, temperature in Fahrenheit | |
| | ratio | differences and ratios are meaningful * / | geometric mean, harmonic mean, percent variation | temperature in Kelvin, monetary quantities, counts, age, length, electrical current | |

ML:II-9 Basics ©STEIN 2005-2013

Types of Attributes

| Туре | | Permissible transformation | Comment |
|------------------------------|---------|---|---|
| categorical (qualitative) | nominal | any one-to-one mapping, permutation of values | A reassignment of employee ID numbers will not make any difference. |

ML:II-10 Basics ©STEIN 2005-2013

Types of Attributes

| Туре | | Permissible transformation | Comment |
|-----------------------------------|---------|--|--|
| categorical nominal (qualitative) | | any one-to-one mapping, permutation of values | A reassignment of employee ID numbers will not make any difference. |
| | ordinal | any order-preserving change of values: $x \to f(x)$, where f is a monotonic | An attribute encompassing the notion of $\{good, better, best\}$ can be represented equally well by the values $\{1, 2, 3\}$. |

ML:II-11 Basics ©STEIN 2005-2013

Types of Attributes

| Туре | | Permissible transformation | Comment | |
|-----------------------------------|----------|--|---|--|
| categorical nominal (qualitative) | | any one-to-one mapping, permutation of values | A reassignment of employee ID numbers will not make any difference. | |
| | ordinal | any order-preserving change of values: $x \to f(x)$, where f is a monotonic | An attribute encompassing the notion of $\{good, better, best\}$ can be represented equally well by the values $\{1, 2, 3\}$. | |
| numeric (quantitative) | interval | $x \rightarrow a \cdot x + b$, where a and b are constants | Thus, the Fahrenheit and Celsius temperature scales differ in terms of where their zero value is and the size of a unit (degree). | |

ML:II-12 Basics ©STEIN 2005-2013

| numeric (quantitative) | | $x \rightarrow a \cdot x + b$, where a and b are constants | Thus, the Fahrenheit and Celsius temperature scales differ in terms of where their zero value is and the size of a unit (degree). |
| | ratio | $x \to a \cdot x$, where a is a constant | Length can be measured in meters or feet. |

ML:II-13 Basics ©STEIN 2005-2013

Remarks:

| Identifying, considering, and measuring an attribute A of an object O is the heart of model formation and always goes along with a sort of abstraction. Formally, this abstraction is operationalized by a model formation function $\alpha:O\to X$. [ML Introduction] |
|---|
| The terms "attribute" and "feature" can be used synonymously. However, a slight distinction is the following: attributes are often associated with objects, \mathcal{O} , while features usually designate the dimensions of the feature space, X . |
| The type of an attribute is also referred to as the type of a <i>measurement scale</i> or <i>level of measurement</i> . |
| We call a transformation of an attribute <i>permissible</i> if its meaning is unchanged after the transformation. |
| Distinguish between <i>discrete</i> attributes and <i>continuous</i> attributes. The former can only take a finite or countably infinite set of values, the latter can be measured in infinitely small units. Be careful when deriving from this distinction an attribute's type. |
| We will encode attributes of interval type or ratio type by real numbers. Note that attributes of nominal type and ordinal type can also be encoded by real numbers. |

ML:II-14 Basics ©STEIN 2005-2013

Particular learning methods require particular attribute types.

Types of Data Sets

Data sets may not be a homogeneous collection of objects but come along with differently intricate characteristics:

- 1. Inhomogeneity of attributes:
- 2. Inhomogeneity of objects:
- 3. Inhomogeneity of distributions:
- 4. Curse of dimensionality:
- 5. Resolution:

Types of Data Sets

Data sets may not be a homogeneous collection of objects but come along with differently intricate characteristics:

1. Inhomogeneity of attributes:

Consider the combination of different attribute types within a single object.

2. Inhomogeneity of objects:

Consider the combination of different objects in a single data set.

3. Inhomogeneity of distributions:

The correlation between attributes varies in the sample space.

4. Curse of dimensionality:

Attribute number and object density stand in exponential relation.

5. Resolution:

The number of objects or attributes may be given at different resolutions.

ML:II-16 Basics ©STEIN 2005-2013

Types of Data Sets: Record Data

Collection of records, each of which consists of a fixed set of attributes:

| ID | Check | Status | Income | Risk |
|----|-------|----------|---------|------|
| 1 | + | single | 125 000 | No |
| 2 | - | married | 100 000 | No |
| 3 | - | single | 70 000 | No |
| 4 | + | married | 120 000 | No |
| 5 | - | divorced | 95 000 | Yes |
| 6 | - | married | 60 000 | No |
| 7 | + | divorced | 220 000 | No |
| 8 | - | single | 85 000 | Yes |
| 9 | - | married | 75 000 | No |
| 10 | - | single | 90 000 | Yes |

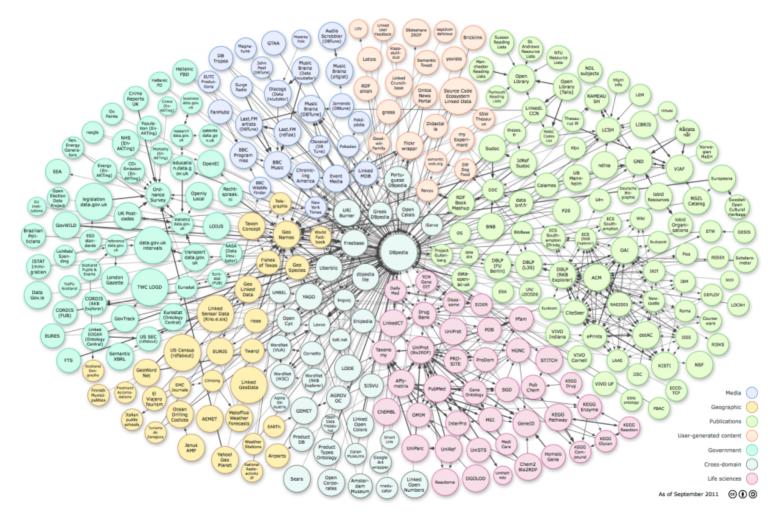

- If all elements in a data set have the same fixed set of numeric attributes, they can be thought of as points in a multi-dimensional space.
- Such data can be represented by a matrix, where each row stores an object and each column stores an attribute.

Example: term-document matrices in information retrieval.

ML:II-17 Basics ©STEIN 2005-2013

Types of Data Sets: Graph Data

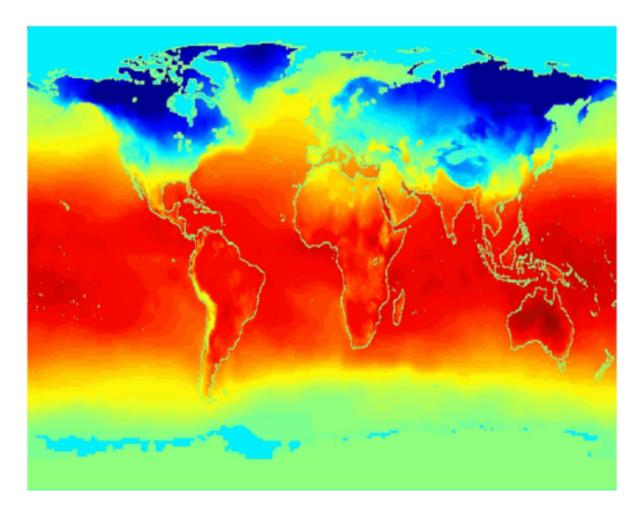

Graph of the Linked Open Data cloud [richard.cyganiak.de]:

ML:II-18 Basics ©STEIN 2005-2013

Types of Data Sets: Ordered Data

Average monthly temperature of land and ocean (= spatio-temporal data):

ML:II-19 Basics ©STEIN 2005-2013

Data Quality

When repeating measurements of a quantity, measurement errors and data collection errors may occur during the measurement process. Questions:

- 1. What kinds of data quality problems exist?
- 2. How to detect data quality problems?
- 3. How to address data quality problems?

ML:II-20 Basics ©STEIN 2005-2013

Data Quality

When repeating measurements of a quantity, measurement errors and data collection errors may occur during the measurement process. Questions:

- 1. What kinds of data quality problems exist?
- 2. How to detect data quality problems?
- 3. How to address data quality problems?

Definition 1 (Precision, Bias, Accuracy)

Given a set of repeated measurements of the same quantity. Then, the closeness of the measurements to one another is called *precision*, a possible systematic variation is called *bias*, and the closeness to the true value is called *accuracy*.

ML:II-21 Basics ©STEIN 2005-2013

Data Quality

When repeating measurements of a quantity, measurement errors and data collection errors may occur during the measurement process. Questions:

- 1. What kinds of data quality problems exist?
- 2. How to detect data quality problems?
- 3. How to address data quality problems?

Definition 1 (Precision, Bias, Accuracy)

Given a set of repeated measurements of the same quantity. Then, the closeness of the measurements to one another is called *precision*, a possible systematic variation is called *bias*, and the closeness to the true value is called *accuracy*.

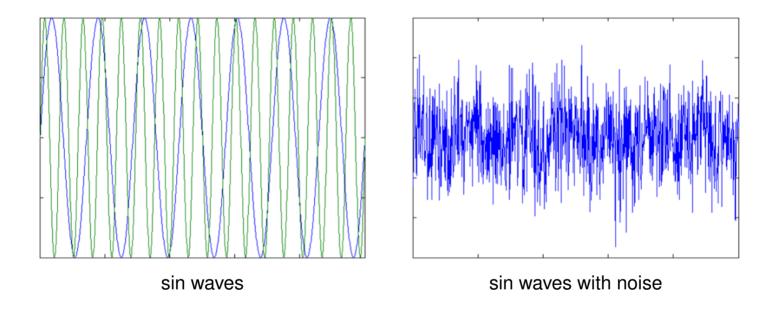

Examples for data quality problems:

- □ noise, artifacts, outliers
- missing values
- duplicate data

ML:II-22 Basics ©STEIN 2005-2013

Data Quality: Noise

Noise refers to random modifications of attributes that often have a spatial or temporal characteristics:

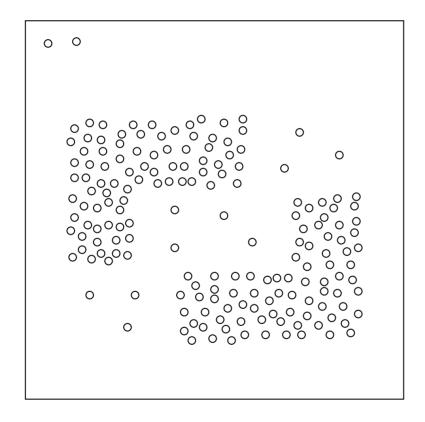

Noise represents the intrinsic variability of data. [Bishop 2006, p.47]

Artifacts refer to more deterministic distortions of a measurement process.

ML:II-23 Basics ©STEIN 2005-2013

Data Quality: Outliers

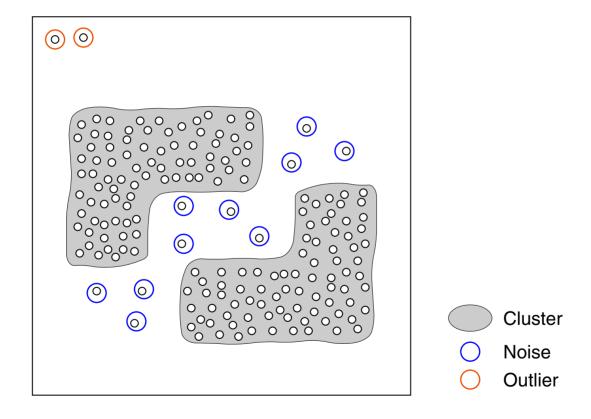

Outliers are members in the data set with characteristics that are considerably different than most of the other elements:

ML:II-24 Basics ©STEIN 2005-2013

Data Quality: Outliers

Outliers are members in the data set with characteristics that are considerably different than most of the other elements:

ML:II-25 Basics ©STEIN 2005-2013

Data Quality: Missing Values

Main reasons for missing values:

1. Information is not collected.

Example: people decline to give their age or weight.

2. Attributes may not be applicable to all elements in O.

Example: annual income is not applicable to children.

Information is not trustworthy.

Example: profile data on Facebook is intentionally misleading.

Strategies for handling missing values:

- eliminate members of the data
- estimate missing values
- ignore the missing value during analysis
- replace with all possible values weighted by their probabilities

ML:II-26 Basics © STEIN 2005-2013

Data Preprocessing

- sampling of object set O
- \Box modeling of objects, $\alpha: O \to X$
- $lue{}$ sampling of feature space X [ML Introduction]
- selection of attributes (features) [attributes versus features]
- transformation of attributes (features)
- discretization and binarization of attributes (features)
- \Box dimensionality reduction of feature space X
